Project Proposal: It’s more cheap in the Philippines?

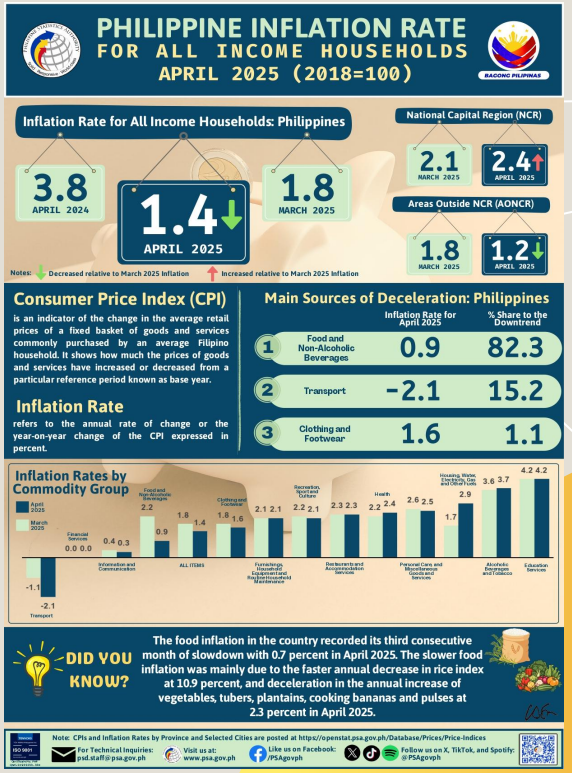

A data visualization project to aid Filipinos with the cost of living in the Philippines.

The cost of living is ever dynamic and dependent on the state of a country’s economy.

The PSA does provide regular updates on the Philippine’s economic status, like the visualizer for the country’s inflation rate on the right.

However, without prior knowledge to understand, it can be confusing to analyse it, in the sense of cost of living.

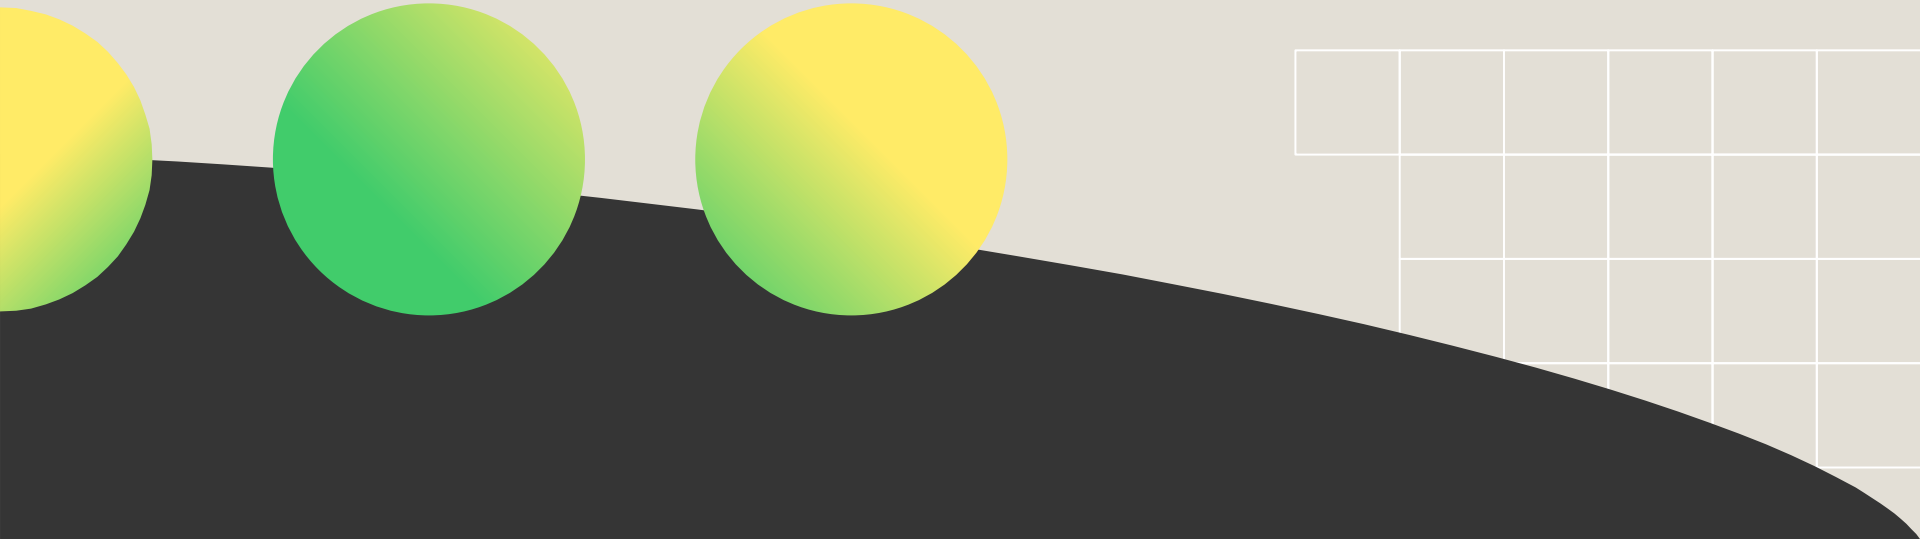

Filipinos may struggle to keep track of the cost of living in the cities / distinct areas in the country.

So, we propose...

Visual aid in showing the cost of living per city/area in the Philippines.

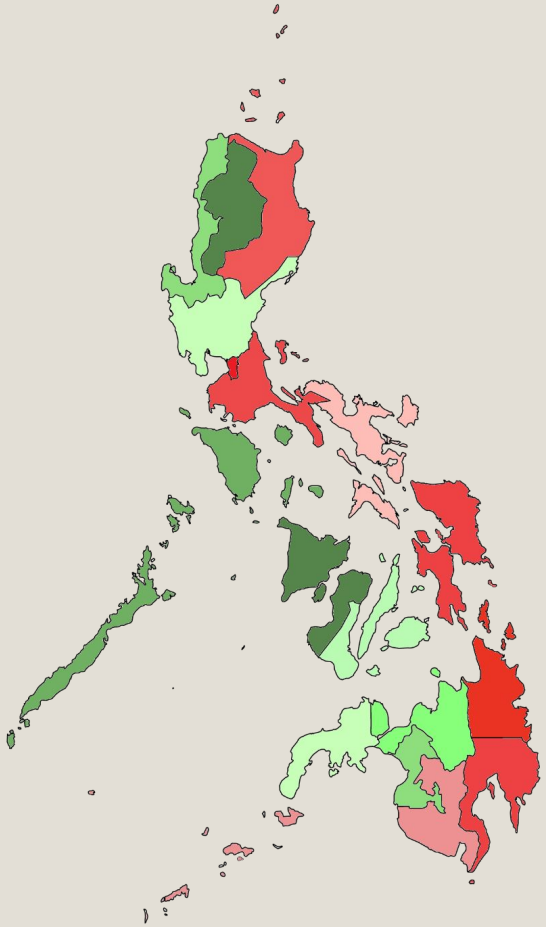

We hope that by developing a helper for pinpointing the cost of living in key places in the country, Filipinos will have an easier time finding affordable and sustainable places to live.

An idea of how the visual aid will look like...

Colouring of each region based on the cost of living.

- Red - expensive
- Green - affordable
- Saturation of both colours determine the severity

Target Audience

Filipinos that are working

Filipinos who are looking for work

(Age range: 20 - 40+)

Data

The following datasets will be used for this project:

OpenSTAT Prices database

Contains multiple datasets on common products and their retail prices.

FIES 2023 Volume 2 dataset

Contains data on the income and expenditures of surveyed sampled households. This is where the cost of living per city/area will be determined.

Thank you!
